

Though Note

Anurag Kumar Singh

I have 2 folders one containing the frontend and the other one containing the backend. In the front end I have made multiple folders inside the src folder which contains different components of the code. This src folder is the main file for the website. It contains all the part excluding the header and footer coded inside it.

In the src folder I have made another folder with the name of Pages. It contains the different pages we will be including in our webpage. The Component folder contains the sections of the pages of the main page and the pages that can be found from the dashboard.

The backend of the code have been divided into 3 different folders.

The .env file with the password to mangodb databas any every other majorly important to you. The controller section of the code contains the controller part of the code for payment, product, and user.

Models folder contains the model I have developed to store data of product, order and user. Routes containing all the routes being used in the backend.

To run the code first install the node modules by typing "npm install" in the main folder client and server folder.

To run the code type "npm start" in the server folder and then type "npm start" in the client folder
